ROCCETT - S

'Ceftriaxone excellence augmented with the power of Sulbactum"

- Ceftriaxone is bactericidal and inhibits the synthesis of the cell wall
- Ceftriaxone has a high degree of stability in the presence of betalactamases both penicillinases and cephalosporinases.
- Sulbactum sodium is a derivative of the basic penicillin nucleus. Chemically it is sodium penicillinate sulfone.

• Sulbactum sodium acts as a beta-lactamase inhibitor thereby preventing destruction of Ceftriaxone by beta-lactamase

producing bacteria.

By addition of Sulbactum the full potential of Ceftriaxone against Enterobacter and Pseudomonas species is restored.

INDICATIONS:

- Mastitis
- Cystitis (Urinary tract infections)
- Endometritis
- Pneumonia (Respiratory tract infections)
- Pre operative Prophylaxis
- Post operative treatment
- Suppurative inflammation, abscess

DOSAGE:

5 – 10mg per kg Body Weight By IM / IV route for 3 – 5 days or as directed by veterinary practitioner
